Disaster Recovery Test Report - Netlube Cloud - 2025

Introduction

This Disaster Recovery (DR) Test Report documents the execution, results, and findings from a scheduled test of Infomedia disaster recovery capabilities. The primary goal of the test is to validate that critical systems and data can be recovered in a timely manner following a disruption or disaster, in line with Infomedia's Recovery Time Objectives (RTOs) and Recovery Point Objectives (RPOs).

Test Overview

Test Name	Annual Disaster Recovery Test - Netlube Cloud
Test Date	Jul 14, 2025
Test Time	Start: 6:30 AEDT End: 7:00 AEDT
Test Location (office/remote)	Remote
Name of tester	@Prince Kumar
Named of test lead	@Benay Debnath

Test Scenarios

AWS Application Image Restoration and Validation

A critical production application hosted in AWS EC2 is compromised due to a ransomware attack. The latest clean Amazon Machine Image (AMI) needs to be restored in a recovery environment.

Steps:

Identify the most recent known-good AMI for the affected application.

Launch a new EC2 instance from the AMI in a DR-designated subnet.

Apply required configuration (security groups, IAM roles, user data, etc.).

Validate that: Application starts without errors. Required services are running. Connectivity to dependent services (e.g., APIs, DB endpoints) is functional. Logs show no errors during boot. **Expected Outcome:** The application launches and behaves as expected. All core features function correctly. Performance is within acceptable range.

Test Scope and Objectives

Scope	Systems, applications, and business functions covered in this test
Objectives	Validate procedures Test RTO/RPO Verify system restoration

Test Procedures

Restore Database from backup.

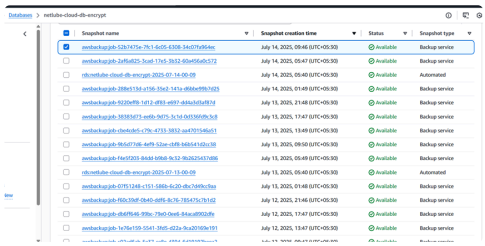

Connect with a live application copy and test all the expected functionality.

Spinning new application server from AMI check the application

Test Results and Evidence

System/Function Tested	Database restoration, Spinning new application server from AMI

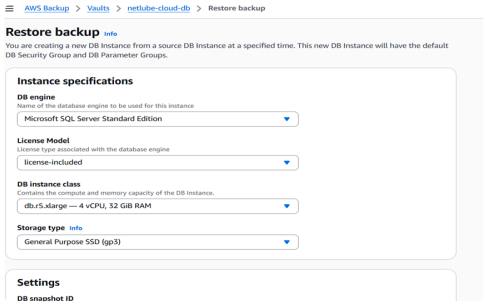

Evidence (e.g., screenshots/logs)

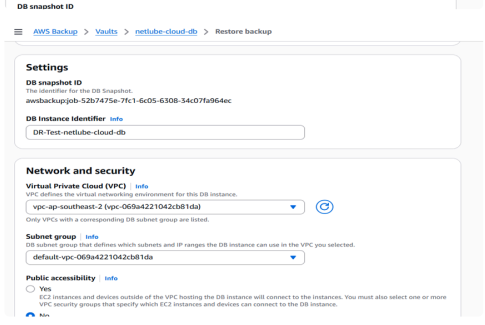

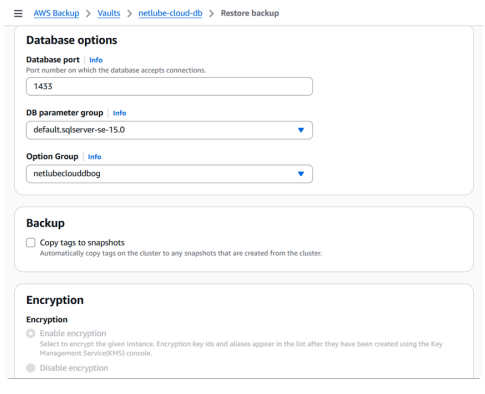

Select appropriate database backup

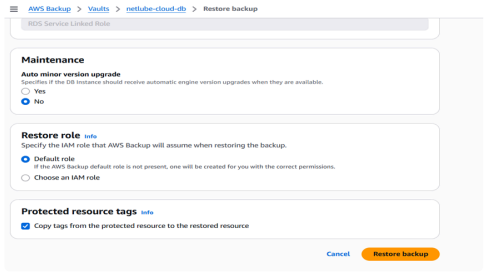

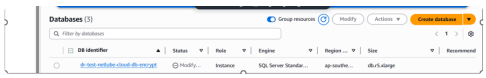

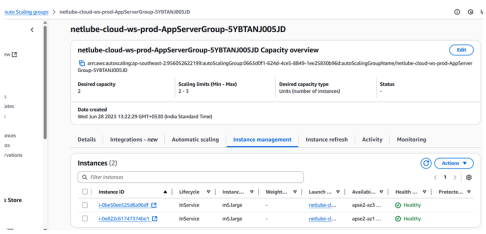

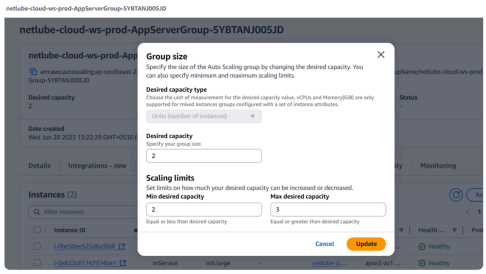

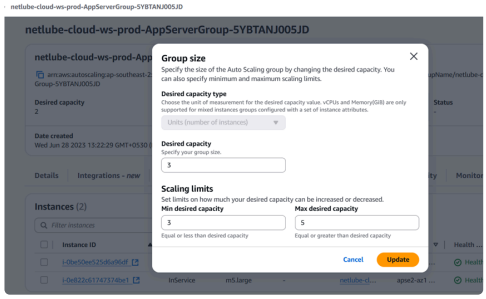

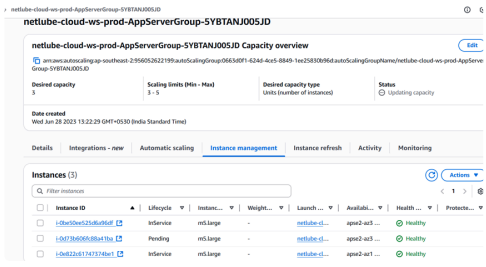

Restore the Database using “Restore” button

	 Database Restored New AMI Spinning  Autoscaling Group selection  Modify the Group Configuration  Modify the required instance capacity  New Healthy instance lunched successfully
Recovery Time Achieved	1 Hour

Gaps and Lessons Learned

Identified Gap	Recommended Action

Approvals
